Title : Age Determined Histophysiological Changes of  
Endocrine Glands at Various Types of Feedings  
in Rabbits.

Ori:Pub : Uch. zap. Khar'kovsk. un-t, 1957, 79, tr.  
n.-i. in-ta biol. i biol. fak. 26, 23-42

Abstract : For 3 generations, 2 groups of rabbits between  
the ages of 4 days to 3 years were raised on  
various food rations. The control group received  
concentrated feeds and the test group was  
raised on feeds which lacked concentrates. Then,

studies were conducted as to physico-chemical changes in protoplasmic protein complexes of the adrenal, thyroid, and thymus glands. The isoelectric point (IEP) and Felgen's reaction were chosen as indicators of these changes. It was established that with advancing age a IEP displacement into the direction of the alkaline group takes place. At the same time, a decrease of nucleic acid contents within protoplasmic protein complexes occurs, a fact which causes a lowering of synthetic process levels. IEP displacement is markedly intensified during early ontogenesis (4 days to 1 month) and is less intensive at advanced age. It displays a more intensive development in the adrenal and thyroid glands, and is less intensive in

"The Magnetic Viscosity of Nickel and Permalloy Under Tension," R. V. Telesnin, Lecturer,  
M. I. Chulkova, L. Ya. Rudaya, 6 pp

"Vestnik Moskovskogo Universiteta" No 1

The initial stage of the magnetic viscosity of extended nickel and permalloy have been studied by means of a Helmholtz pendulum interpreter. A strong influence of the magnetic viscosity on the velocity of the change in the magnetization of the extended nickel and permalloy has been discovered.

M. I. A. V. Ryabchenko, Doctor of Chemical Sciences, Professor; Ed. of Publishing House A. I. Shirokin, Engineer; Tech. Ed. B. I. 'Ozdai'; Managing Ed. for Literature on Heavy Machine Building (Mosgiz); G. S. ca. Golovina, Enginner.

PURPOSE: This collection of articles is intended for designers, technologists, and industrial and research workers concerned with corrosion and corrosion protection of metals.

CONTENTS: This collection of articles deals with problems of corrosion and metal protection under investigation at TsNITMash during the past two years. The articles discuss stress corrosion, intergranular corrosion, scale and heat resistance of austenitic steels, corrosion fatigue, protective coatings, freezing corrosion, and resistance of metals to cavitation. No personalities are mentioned. References follow each article.

## TABLE OF CONTENTS

Growth changes in electrocolloidal properties of rabbit tissue protoplasm in various types of growth. V. N. Nikitin, Yu. A. Bashin, T. A. Butoskaya, S. A. Brailovskaya, M. F. Volovik, and A. V. Rudayeva (People's Univ., Kharkov). *Zhur. Obozr. Biol.* 13, 270-80 (1982).—The isoelectric point (IEP) of karyoplasm and cytoplasm changes during growth, first rapidly and then more slowly, toward the alk. side. This is related to the intercellular compds. of the cerebral cortex and the cerebellum; also to the thyroid colloid. It may be evidence of nucleic acid impoverishment in protoplasm during growth. Changes in IEP in spermatogenetic epithelia are similar to changes in other rabbit tissues. Differences in IEP in different organs lessen gradually as the animal grows, indicating that the body protein complexes are becoming less heterogeneous; and as growth continues there is a shift of IEP toward the acid. side. This shift was not observed in protoplasm from pituitary cells. Julian F. Smith

"Electric Contact Method for Determination of the Speed of Rolled Metal,"  
I. M. Pavlov, N. P. Ganin, I. V. Rudbakh, M. I. Kapustina, Moscow Inst of  
Steel imeni I. V. Stalin

"Zavod Lab" Vol XVI, No 9, pp 1074-1075.

Describes equipment used for determining speeds of metal in rolling process by method of electric contacts. Speeds of front and rear ends of billet and circumferential speed of rollers are determined directly. Therefore, not only a lead, but also a lag may be determined experimentally. One of essential advantages of method is independence of measuring accuracy from variations in temperature of metal and rollers.

ACCESSION NR: AP5002177

8/0032/65/031/001/0094/0100

AUTHORS: Gladshteyn, L. I.; Rudchenko, A. V.

TITLE: On the evaluation of the resistance of structural steel to the development of brittle fracture

SOURCE: Zavodskaya laboratoriya, v. 31, no. 1, 1965, 94-100

TOPIC TAGS: structural strength, structure analysis, steel fracture, steel/ 10G2S  
steel, St 3ps steel, M St 3ps steel, M St 3kg steel, MSt3 steel, 15G3 steel, 14 G2

ABSTRACT: The work of several scientists and authors in characterizing the fracture of structural steels at low temperatures is reviewed. Among the authors and research works mentioned were: T. S. Robertson (J. of the Iron and Steel Inst., v. 175, p. 361, D (1953)); D. K. Felbeck and E. Orowan (The Weld. J. Res. Suppl., 34, No. 11, p. 570-S (1955)); E. Orowan (Sb. "Atomnyy mekhanizm razrusheniya", Metallurgizdat, 170 - 184 (1963)); V. A. Bykov (Zavodskaya laboratoriya, XXIV, 9 (1958)); N. P. Shapov and E. S. Volokhvyanskaya (Sb. "Problemy metallurgii", Izd. AN SSSR, 409 (1953)); and N. P. Shapov (Zhurnal tekhnikeskoy fiziki, t. XXIV, 3 (1954)). In tests conducted by the authors, rectangular plates with symmetrically placed slot cuts (see Fig. 1a on the Enclosures) were used in tensile strain tests

Card 1/5

L 24151-65

ACCESSION NR: AP5002177

conducted at various temperatures; similar tests were conducted on specimens cut as shown in Fig. 1b on the Enclosures. The tests results are plotted in Figures 2 and 3 on the Enclosures. Testing was also performed upon slotted specimens exposed to bending and subsequent straightening and upon slotted specimens simply supported at both ends and point-loaded at the center. Comparison was made with the conclusions of other writers. The authors concluded that: 1) methods of comparative evaluation of a steel resistance to brittle fracture and methods of obtaining the same steel structural reliability are both necessary; 2) some features of Robertson's reliability tests are unfavorable; 3) resistance to brittle fracture can be determined experimentally using full-scale or simulated specimens; 4) brittle fracture resistance calculation methods must be sufficiently differentiated; 5) the appearance of brittle fracture depends upon the plastic deformation of the steel. Orig. art. has: 6 figures and 1 table.

TITLE: Investigation of the Mechanical Aging of Steel by the Method of Combining Real Expansion Diagrams (Issledovaniye mekhanicheskogo stareniya stali metodom sovmeshcheniya istinnykh diagramm rastyazheniya)

PERIODICAL: Zavodskaya Laboratoriya, 1958, Vol 24, Nr 10, pp 1236-1239 (USSR)

ABSTRACT: The present standard method of classifying the aging tendency of steel (GOST 5520-50) is based on measuring the resilience of the steel at room temperature (Refs 1,2) and does not make possible a quantitative classification. In the present method the expansion curve of the same steel obtained after cold hardening and aging is plotted on the expansion curve of the steel (in the initial state) plotted according to real values of the coordinates deformation - stress. This method makes possible differentiation between the hardening effect caused by aging and that caused by cold hardening. This method is practical in that no complicated samples are needed, and simple apparatus as, for instance, the testing machine IM.-4A can be used. The technique employed is described and a graph of the diagrams

Investigation of the Mechanical Aging of Steel by the Method of Combining  
Real Expansion Diagrams

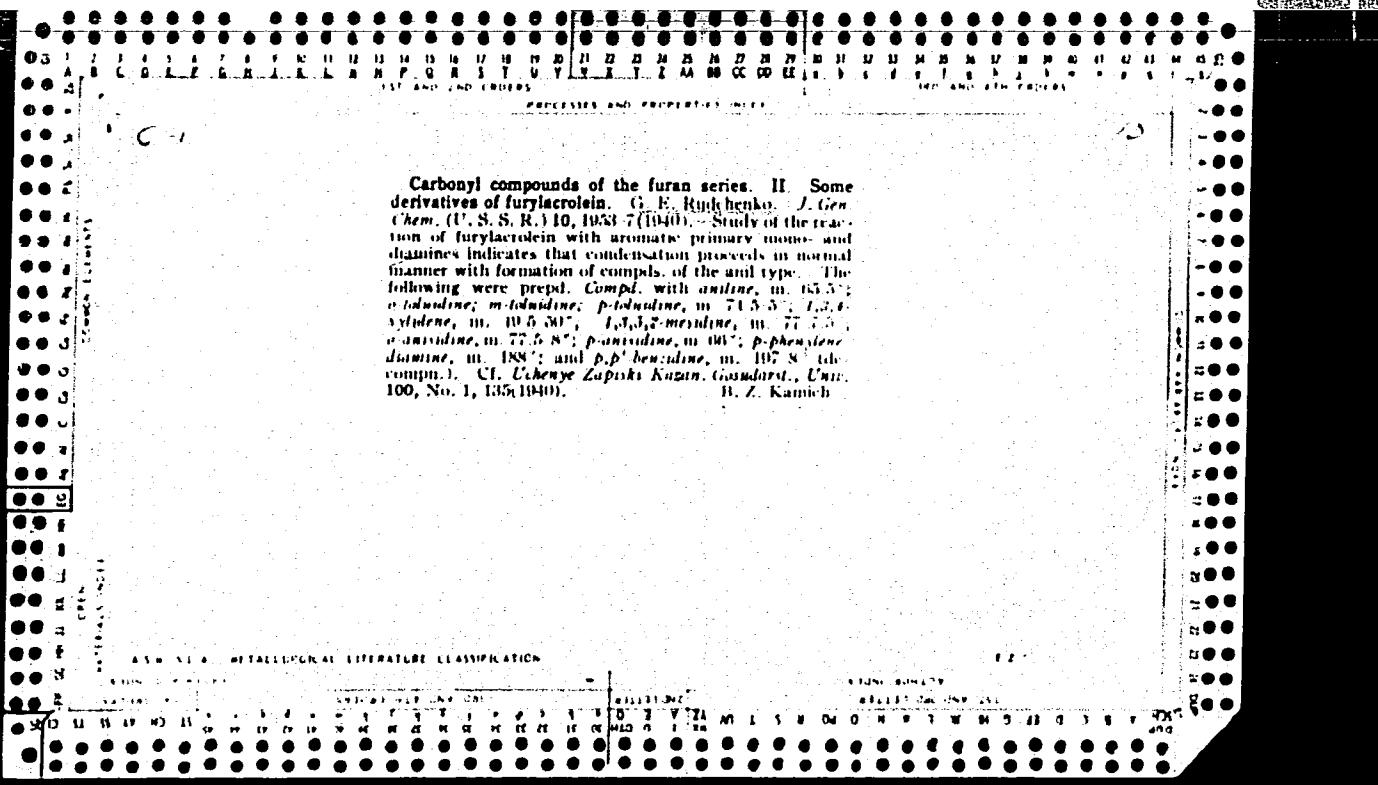

obtained in testing the steel samples type Mst3 (0,14% C,  
0,44% Mn, 0,055% Si, 0,037% S and 0,031% P) is given. Also  
diagrams of the tests of steel samples of type Mst.3 hardened at  
930° in oil as well as of those cooled in the furnace are given.  
It was found that the natural and the artificial aging of a  
cold hardened steel are of a different character. In contrast  
to the present ideas regarding the aging of carbon steels a  
quick cooling from the austenite state does not decrease the  
tendency to mechanical aging. There are 3 figures and 5 refer-  
ences, 2 of which are Soviet.

TITLE: Multiple scattering of nitrogen and oxygen ions in aluminum 27 27

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 50,  
no. 3, 1966, 589-594

TOPIC TAGS: oxygen, nitrogen, aluminum, multiple scattering,  
angular distribution, ion interaction

ABSTRACT: The authors use a system of proportional counters to measure  
the angular distribution of  $N^{14}$  and  $O^{16}$  ions with initial energy  $\sim 0.3$  MeV/nucleon after multiple scattering in aluminum foils. The measurements were made with a 72-cm cyclotron, using essentially a technique previously developed for a study of equilibrium distributions 2

of charges in ion beams (ZhETF v. 39, 905, 1960 and earlier papers) (Fig. 1). In addition to measuring the angular distributions, the authors measured the charge composition of the beam of ion scattered at angles up to  $\pm 1.5^\circ$ . The angular distributions obtained were analyzed on the basis of the Moliere-Bethe theory (Phys. Rev. v. 89, 1256, 1953), developed for scattering of fast charged particles by

Card 2/3

L 24393-66  
ACC NR: AP6010979

atoms described by a statistical model. Although the theory is incomplete in that it does not show the dependence on the particle charge, the experimental angular distributions agree satisfactorily with the theoretical distributions if one uses for the charge of the moving ion the rms charge of the ions in a beam of equilibrium charge composition. TITLE: Protective action of acridine orange against ultraviolet irradiation of DNA-infected bacteriophage 1 sub Phi 7

SOURCE: AN SSSR. Doklady\*, v. 155, no. 4, 1964, 937-939

TOPIC TAGS: bacteria destroyer, bacteriophage, phage, bacteriolytic agent, acridine orange, DNA, desoxyribonucleic acid, deoxyribonucleic acid, biochemical research, physiological research, TNA, spheroplast

ABSTRACT: In the interaction of the basic dye acridine orange (AO) with DNA two complexes are formed: complex I, probably consisting of AO dimers or higher aggregates and complex II is an AO monomer. Complex I is mostly formed with single-chain DNA and RNA, while complex II is formed with native double-chain DNA. The purpose of the present work was to find whether AO can be used as protective substance against inactivation of infectious DNA by UV radiation. In the tests, DNA of the intestinal phage 1 $\phi$ 7 was used. DNA isolated from 1 $\phi$ 7 is infectious for spheroplast bacteria. DNA separation was done according to the phenolic

Card 1/3

ACCESSION NR: AP4030793

method. Spheroplasts were prepared from a broth culture of E.coli C. An elaborate test showed that dyeing of infectious DNA with AO in a  $5 \cdot 10^{-7}$ M concentration caused practically no screening of UV light. The same test was repeated with  $\lambda \varphi 7$  bacterio. phage. AO dye has no effect on the whole phage (DNA + albumin skin) since it does not penetrate through the albumin skin. Neither does UV radiation. With increased AO concentrations, the quanta input of lethal UV action decreases ( $5 \cdot 10^{-7} = 1.6x$ ;  $2.5 \cdot 10^{-6} = 2.85x$ ;  $5 \cdot 10^{-5} = 4.8x$ ). The tests showed that in a DNA solution dyed with AO and irradiated with UV light (of the nucleic acid absorption spectrum), the dye protects DNA from inactivation by the UV quanta. This means an effective energy migration from the DNA base to the dye with subsequent light output or heat conversion. Orig. art. has: 1 figure, no formulas, no tables.

AUTHOR: Rudchenko, P. A.

TITLE: Calculation of the Filtration Discharge from Channels of  
Arbitrary Cross SectionPERIODICAL: Dopovidi Akademii nauk Ukrains'koi RSR, 1959, Nr 8,  
pp 853 - 857 (USSR)ABSTRACT: In this article, the author presents two new formulae for  
determining the filtration discharge from a rectangular  
channel of infinite length. They are:

$$Q_s = \frac{\pi H}{\lambda + \arcsin \lambda - 0,238312\lambda^{7/5}x^3 + \dots}, \quad (1)$$

$$Q_s = \frac{\pi^2 B}{4 (1 - 0,21117 \sqrt[3]{\lambda}) \arccos^2 \lambda} \quad (2)$$

Card 1/3

Whereby  $Q_s$  stands for filtration discharge and  $\lambda$  for parameter.ASSOCIATION: Kiyevskiy inzhenerno-stroitel'nyy institut (Kiyev Engineering-  
Construction Institute)

PRESENTED: B. V. Hnedenko (B. V. Gnedenko) Member, AS Ukr SSR

SUBMITTED: February 17, 1959

SOV/21-59-8-9/26

Calculation of the Filtration Discharge from Channels of Arbitrary  
Cross Section

When calculating  $Q_s$  by formula (1), the error does not exceed 3%. It is known that when  $0 \leq \lambda \leq 0.9$ , the error is not more than 0.2%. The formula (2), when  $0.4 \leq \lambda \leq 1$ , gives an error not exceeding 0.5%. Thus, the two formulas enable us to determine  $Q_s$  with an accuracy of up to 0.5%.

For calculating the parameter, the author quotes the following formulas:

$$\lambda \approx \lambda_2 = \lambda_1 - \frac{\frac{\pi B}{8H} (\lambda_1 + \arcsin \lambda_1) - (1 - 0.2376\sqrt{\lambda_1}) \arccos^2 \lambda_1}{\frac{B}{2H} K_1 + K'_1} \quad (4)$$

$$\lambda \approx \lambda_2 = \lambda_1 - \frac{\frac{\pi B}{8H} (\lambda_1 + \arcsin \lambda_1 - 0.238312\lambda_1^2) - (1 - 0.21117\sqrt[3]{\lambda_1}) \arccos^2 \lambda_1}{\frac{B}{2H} K_1 + K'_1} \quad (5)$$

Card 2/3

Calculation of the Filtration Discharge from Channels of Arbitrary Cross  
Section

SOV/21-59-8-9/26

Whereby  $K_1$  and  $K_1'$  mean full elliptic integrals of the first kind. When calculating the  $\lambda$  parameter according to formula (4), the error does not exceed 0.6%. The formula (5), when  $0.4 \leq \lambda \leq 1$  gives an error of not more than 0.12%. With small values of  $\lambda$  the formula gives an error up to 3%. The article also discusses the application of the successive conformal mapping method of P. F. Fil'chakov for solving the problem of filtration from a channel of arbitrary cross section in a case of finite depth of the draining layer. The results obtained, are practically quite satisfactory. New approximate formulae were obtained for determining the filtration discharge from a rectangular channel with finite depth of the draining layer, which give more accurate results than the other approximate formulae available. There are 1 diagram and 3 Soviet references.

EXCEP'TA MEDICA Sec.13 Vol.11/2 Dermatology,etc.Feb57

401. RUDTCHENKO S. N., TUMASCHEVA N. I. and SLUVKO Z. A. All-Union Inst. for Study of Leprosy, Astrakhan, USSR. \*The treatment of leprosy with 'tibon' (Russian text) VESTN. VENER. DERM. 1955, 2 (34-35)  
The authors sum up the results of 4 years' treatment of leprosy with 'tibon', a preparation of the thiosemicarbazone group ('87'). The best method, as it proved to be, was one of intermittent courses - the single course lasted 10 days followed by a rest. A single dose was 0.025-0.1 g.; the total for 24 hr. was 0.05-0.2 g.; 12-14 courses constituted the whole period of treatment, which lasted 6-7 months. The total dosage of the drug for the period was 14-30 g. The treatment was then discontinued for 4-6 weeks, and resumed with the same technique twice - up to 4 times in the course of 2-3 yr. The supporting treatment administered concurrently included vitamins, physiotherapy, etc. The therapeutic effect becomes apparent after 5-6 courses, i.e. towards the end of the 3rd month. Out of 70 lepers a positive result was obtained in 60%. A complete clinical cure was attained only in the early stage of the disease. In the nodular form of leprosy positive results were attained in 90% of the patients. The authors used also a combined treatment of 'tibon' and intradermal injections of ol. chaulnoograe preparations. Such a combined treatment gave the best results and permitted the rest periods to be lengthened to 3-4 months.
